

LEARN TO USE MS ACCESS 2010

Chapter-2

A. Multiple Choice Questions

- 1) Data is entered in the view.
(a) Design (b) Datasheet (c) Both (a) and (b) Answer: (b) Datasheet
- 2) is the shortcut to rename a table.
(a) F2 (b) F4 (c) F8 Answer: (a) F2
- 3) A is located at the intersection of a column and a row.
(a) form (b) field (c) value Answer: (c) value

B. Fill in the blanks.

- a) In Microsoft Access, the data is arranged in the form of Ans : table
- b) Several templates appear by clicking from the New window. Ans : More template option
- c) A primary key does not allow Ans : Null values
- d) There are views to work with a table. Ans : two

C. Match the following.

1. Ctrl+S (a) used to move backward by one record every time when clicked.
Ans : (f) Save a database
2. Ctrl+O (b) It inserts a blank row at the end of the table to add a new record in the table.
Ans : (e) Open an existing database
3. Alt+F4 (c) Rename a table.
Ans : (d) Quit Microsoft Access
4. F2 (d) Quit Microsoft Access
Ans : (c) Rename a table.
5. Previous Record (e) Open an existing database
Ans : (a) used to move backward by one record every time when clicked.
6. New Record (f) Save a database
Ans : (b) It inserts a blank row at the end of the table to add a new record in the table.

D. Write T for true and F for false statements.

- 1) There are two ways to create a table in a database. Ans : True
- 2) A record is located at the intersection of a column and a row. Ans : False
- 3) The initial code name of MS Access was Cirrus. Ans : True
- 4) The reports are designed to be printed. Ans : True
- 5) The Microsoft Access is a popular Relational Database Management System. Ans : True

E. Very Short Answer Questions

- 1) What does the backstage view show?
Ans: The backstage view shows the set of commands used to manage database like creating, saving, opening and printing.
- 2) Define template with an example.
Ans: A template is a ready-to-use database that contains tables, queries, forms and reports needed to perform a specific task. For example, student database.

F. Short Answer Questions

- 1) Mention the different ways to create a database.
Ans: Microsoft Access 2016 provides the following ways to create a database:
(a) creating a blank database
(b) creating a database using a template
(c) creating a database by downloading a template

2) What is the difference between the Datasheet View and the Design View in a table?

Ans: The main difference between the Database view and the Design view in a table is in Data sheet view, entry of data in a table is done directly while in Design view, it first creates the table structure.

3) What is a primary key? State its use in a table.

Ans: A table should have at least one field that has a unique value for each record this field is called Primary Key. A primary key does not allow Null values and must always have a unique value. A primary Key is used to relate a table to foreign keys in other tables.

4) How do you close a database?

Ans: To close a database in Microsoft Access, follow these steps:

1) Click the File tab.

2) Click the Close Database option from the Backstage View.

Ms Access closes the database.

G. Long Answer Questions

1) Explain the data types in the Microsoft Access.

Ans: -

a) Short Text: The Short Text data type contains letters, numbers, and symbols. It can store up to 255 characters. *Example:* Name, Address, Phone Number.

b) Number: The Number data type stores numeric values that can be used in mathematical calculations. *Example:* Marks, Age, Roll Number.

c) Currency: The Currency data type stores monetary values with currency symbols. *Example:* ₹100, \$50.

d) Date/Time: The Date/Time data type stores dates and times. *Example:* 01/01/2026, 10:30 AM.

e) Long Text: The Long Text data type stores lengthy text up to 65,536 characters. *Example:* Description, Remarks.

f) Yes/No: The Yes/No data type stores only one of two values such as Yes/No, True/False, or On/Off.

2) Write the steps to open an existing database.

Ans: To open an existing Access database, follow the given steps:

Step 1: Click the File tab.

Step 2: Click the Open option from the Backstage view. The Open window appears.

Step 3: Click the Browse option.

Step 4: Select the required database to open and click the Open button. The selected database is opened.

3) Write the steps to start Microsoft Access 2010.

Ans: To start MS Access, follow the given steps:

Step 1: Click the Start button

Step 2: Click All Programs

Step 3: Click Microsoft Office.

Step 4: Click Microsoft Access 2010.

4) Explain any two objects of a database.

Ans : Two objects of a database are:

Table : A table is a part of the database where the actual data is stored. MS Access stores the related entries in its row. This row is called a record. Each type of detail in a record is stored in its columns, known as fields. For example, a table having the names of all the students of your class can be stored in one field with the field name as 'Name' and all the data entries under the field names, 'Name', 'Age', 'Address,' together form the record of a particular student.

Query : A query is used to extract information from a database. The output of a query is a record or a group of records that fulfils a certain condition. An example of a query is to 'get the record of the student with Roll No. 32'.

H. Computer in Everyday Life (Application based Questions)

- 1) The Principal of a school requires to store the information about the students of the school. Which application software should he/she use to create a database?

Ans: Principal should use Microsoft Access 2010 to create a database.

- 2) Nidhi created a table named School (with fields including Admission No, Roll No, Name and Class). Which field out of these should be set as the Primary key and why?

Ans: Nidhi should make Admission No. as primary key because Admission No. is unique and cannot be null.

Extra Questions-

1. What is a difference between data and information?

Answer – Data – The raw facts constitute data. The facts may be related to any person, place, activity, or thing. It may be stored in the form of text, graphics, audio, or video.

Information – Information is the processed or organized form of data. If the data is not correct or accurate, the information obtained by processing such data may not be correct. For example, marks obtained by students and their roll numbers are the data, while the report card/sheet is the information.

2. What is a database?

Answer – A database is an organized collection of data. Databases can store, retrieve, and manage large amounts of data. The database stores the information in the form of a table.

3. What is a database management system?

Answer – A database management system (DBMS) is a software package which manages and maintains data in a database. A DBMS enables several user applications programs to access the same database at the same time. It enables organizations to easily create databases for a variety of purposes. A database is a comprehensive collection of data records, files, and other items.

4. How is data organized in a database?

Answer – Data can be organized in a database in two ways:–

- Flat File – It stores the data in a single table, and it is suitable for small amounts of data.
- Relational – It stores the data in multiple tables, and all the tables are connected to each other using a common field with the help of relationships.

5. What is an entity in a database?

Answer - An entity is a real-world object about which information is stored in a database. Each entity has a collection of attributes that describe it.

Example: If you want to store student information in a table, then Student is the entity, and Name, Roll No., and Class are its attributes.

6. What is a table in a database?

Answer – A table is a collection of logically related records. It is organized as a set of columns and can have any number of rows.

7. What is another name for a record?

Answer: Tuple (or Row)

8. What is another name for a field?

Answer: Attribute (or Column)

9. What different types of keys are available in RDBMS?

Answer – The different keys available in RDBMS are –

- a) Primary Key (PK) –
- b) Candidate Key (CK)
- c) Alternate Key (AK)
- d) Foreign Key (FK)

10. What is RDBMS?

Answer – RDBMS stands for Relational Database Management System, which is an upgraded version of DBMS. RDBMS stores the data in the form of a table. In RDBMS multiple tables can be linked together, and support multiple users to access the database.

11. What is an object in a database?

Answer – An object in a database is a structure or a feature that is used to store, represent, or retrieve data. In fact, a database is a collection of objects. Various objects in a database are –

- a) Table b) Form c) Queries d) Report

12. Give the advantages of a database.

Answer – Advantages of database are –

- Reduce Data Redundancy – When the same data set is stored in two or more locations, this is referred to as data redundancy. As a result, this helps in the protection of duplicate data in a database.
- Sharing of Data – Databases can share the data with multiple users at a time. There are multiple levels of authorization to access the data, and as a result, the data can only be shared with those who are permitted.
- Data Integrity – The term “data integrity” refers to the accuracy and consistency of the data in the database. Data integrity also refers to data safety.
- Data Security – You know that data is very important; databases give privileges to authorized users and allow them to access the database using a username and password.
- Privacy – A database’s privacy rule says that only authorized users are permitted to access the database. For example, if you log in to your Gmail account, then you will see your email only; you will not see any other account email.
- Backup and Recovery – Backup and recovery are handled automatically by the database management system.
- Data Consistency – Data consistency ensures the modification in the data will be the same for all the users who are accessing the database. For example, if you have a registered recovery backup ticket from the IRCTC website, then whatever changes are there, it will be the same for all the users who are trying to reserve the ticket.

13. What are the ways to create a table in MS Access?

Answer – There are two ways to create a table in MS Access:

- a) Datasheet View
b) Design View

14. What are the components of the Microsoft Access window?

Answer:

- a. Title Bar
b. Ribbon
c. Quick Access Toolbar
d. File Tab
e. Navigation Pane
f. Tabbed Documents
g. Status Bar

15. What is a Quick Access Toolbar?

Answer: The Quick Access Toolbar provides shortcuts for commonly used commands such as Save, Undo, and Redo.

16. What is a Navigation Pane?

Answer: The Navigation Pane displays all database objects such as tables, forms, queries, reports, pages, macros, and modules.

17. What is SQL?

Answer: SQL (Structured Query Language) is a programming language used to retrieve and update information in a database.

18. What are the points to remember before creating a database?

Answer:

- Purpose of the database
- Users of the database
- Tables required
- Queries required
- Forms and reports required

19. What are the rules for naming a field?

Answer: The rules for naming a field are:

- a) A field name can range from 1 to 64 characters.
- b) A field name can include letters, numbers, and special characters.
- c) A field name cannot begin with a blank space.

20. What is a relationship in a database management system?

Answer – Relationship is a logical connection between two or more tables; relationship helps to check redundancy and inconsistency of data.

21. What is the advantage of relationships between two tables?

Answer – Advantage of relationships between two tables are –

- Save time, as there is no need to enter the same data in separate tables.
- Reduce data-entry errors.
- Summarize data from related tables.

22. What are the advantages of relationship in a database?

Answer – There are various advantages of relationship tables in a database. Few of them are as given below.
School Subject Notes

- A relationship can help prevent data redundancy.
- It helps prevent missing data by keeping deleted data in a database.
- Creating relationships between tables helps prevent invalid data from being entered into the database.
- Any update in the master table is automatically reflected in the transaction tables.

23. What is the file extension of MS Access 2010?

Answer – The file extension of MS Access 2010 database files is .accdb.

24. What is a query in a database?

Answer – Queries help to retrieve and display data from one or more tables in a database. This is done by giving specific search criteria to the DBMS so that we are able to view the exact information that we want.

25. What are the different ways to create queries in MS Access 2010?

Answer – Queries in MS Access 2010 can be created in the following ways-

- a) Using Query Wizard
- b) Using Query Design (Design View)

26. What is a form in a database?

Answer – A form is an object of the database that has a user-friendly interface where data can be entered and seen in an attractive and easy-to-read format. This form is also known as a front-end application where the user can enter the data.

27. How many ways are there to create a form in MS Access?

Answer – There are three ways to create a form in MS Access:

1. Using Form View
2. Using Form Wizard
3. Using Design View

28. What do you mean by report?

Answer – Report helps to present the retrieved data in an attractive and customized manner. We can create a report based on a table or a query or both.

29. Differentiate between Forms and Reports.

Answer –

Form

- a) Forms are used to store the data in a semantic way.
- b) Edit, delete, & modify can be easily managed.
- c) Auto calculation can be done easily.

Report

- a) Report displays the data in the presenting format
- b) The report can display all the records from the table.
- c) Edit, delete, & modification cannot be done through report
- d) You can take a printout with the help of the report.

30. What is Sorting?

Answer: Sorting is the process of arranging records in a specific order, either ascending or descending, based on the values in a field.

Ascending Order: A to Z, 0 to 9

Descending Order: Z to A, 9 to 0

Example: Arranging student names alphabetically from A to Z.

31. What is Filtering?

Answer: Filtering is the process of displaying only those records that satisfy a specified condition while temporarily hiding the other records.

Example: Displaying only the records of students who belong to Class VIII.

32. What key is used to rename a table?

Answer: F2

33. Which key saves a database?

Answer: Ctrl + S

34. Which key opens an existing database?

Answer: Ctrl + O

35. Which key closes MS Access?

Answer: Alt + F4

36. Which view is used to enter data?

Answer: Datasheet View

37. Which view is used to create table structure?

Answer: Design View

38. Which database object is used for printing data?

Answer: Report

39. Which database object is used for easy data entry?

Answer: Form

40. Which database object is used to retrieve information?

Answer: Query
